Transcriptional pattern translation: osteoarthrosis, the condition of osteoarthrosis, osteoarthrosis, osteoarthrosis. Partial loss of cartilage and rupture of the underlying bone. The most common symptoms are joint pain and stiffness. Symptoms usually progress gradually over the years. Initially they can only be seen after exercise, but can be visible over time. Other symptoms may include joint inflammation, decreased range of motion, and, when the back is affected, weakness or numbness of the hands and feet. Unlike other types of arthritis, only joints, internal organs are not affected. Causes include past joint injury, abnormal joint or organ development, and inherited factors. The risk is higher in those who are overweight, have legs of different lengths, or have jobs that result in higher levels of joint stress. Osteoarthrosis is considered due to mechanical stress on joint and low grade inflammatory process. It develops as cartilage gets lost and the underlying bone gets affected. It can be difficult as exercise as pain, muscle strain. Diagnosis is generally based on signs and symptoms, in which medical imaging and other tests are used to support or rule out other problems. Unlike rheumatoid arthritis, the joints in osteoarthrosis are not hot or red. Treatment involves exercise, reducing joint stress such as stretching or using cane, support groups and pain medications. Weight loss can help overweight. Pain medications may include ibuprofen (ibuprofen) as well as NSAIDs such as naproxen or diclofenac. Long-term opioid use Due to lack of information about benefits as well as the risk of addiction and other side effects.
